

OB1 Odysseys — Program Summary & Website Context

Context document for development (Claude Code)

1. Program Overview

OB1 Odysseys is an environmental storytelling program built around the theme "**Save the Planet with Data.**" The program is run by a former enterprise analytics leader (background at Workday and Oracle) transitioning into environmental evangelism. The core idea: use real eco-tourism travel as field research, turn what's observed into short-form video Public Service Announcements (PSAs) for social media, and back every PSA with a rigorous, sourced, data-driven case published on a companion website.

The mission is to raise visibility and urgency around environmental regulation and action, and to help drive the transition to a sustainable economy and healthier planet.

Persona: "OB1" — a Jedi-inspired evangelist persona, playful in tone but serious in substance. Existing home base: Instagram [@ob1odysseys](#).

2. Program Thesis (the "why")

The program operates on the hypothesis that we are at a climate **inflection point**, driven by three converging forces:

1. **Climate urgency** — measurable, visible effects of greenhouse gas emissions (rising temperatures, wildfire severity, drought, ecosystem loss).
2. **Economic shift** — renewable energy becoming cheaper and more abundant than oil, changing the economics and geopolitics of energy.
3. **Political will gap** — the missing piece is not evidence, it's action; individual and institutional will lags behind both the science and the economics.

The program's bet: analytics discipline (clear evidence, clear stakes, clear stories) can close that will gap the way it has historically closed decision-making gaps in enterprise settings.

3. Content Model: The "Odyssey" Format

Each **odyssey** is a place-based research trip that becomes a PSA story. Every story follows the same structure, both in the short-form video and on the website:

Component	Purpose
Problem Statement	What ecological change is happening, where, and why it matters
Analysis	The data/evidence behind the claim — trends, comparisons, forecasts
Call to Action	What the viewer/reader can do — advocacy, regulation support, behavior change
Sources	Citations for every claim (scientific studies, agency data, news)
Datasets	Underlying data made available/downloadable or visualized for transparency

This structure is meant to give each PSA credibility beyond typical short-form content — it should read as "public service announcement backed by open data," not opinion content.

Current Odysseys in Development

1. **"AI Was Right"** — Pacific Crest Trail wildfires. Compares the scale and impact of wildfires along the PCT over the last 25 years. (Only have data and analysis for this for now)
2. **Utah National Monuments Odyssey** — A 14-day journey through Utah's dry, windy, high-desert national monuments, documenting land and climate change impacts.
3. **Joshua Tree Odyssey** — A forecasted story projecting the loss of ~90% of Joshua trees in Joshua Tree National Park over the next 50 years.

(This list will grow — the website architecture should assume new odysseys will be added over time, not just these three.)

4. Distribution Channels

- **Social media (primary discovery layer):** Short-form video PSAs published across platforms (Instagram is the current anchor — @ob1odysseys), designed for reach and emotional/visual impact.

- **Website (primary credibility/depth layer):** Each PSA links back to a website page with the full problem statement, analysis, call to action, sources, and dataset for that odyssey. The website is the "show your work" layer that social video can't accommodate.
-

5. Website Goals & Requirements (for Claude Code)

Primary goal: Give every PSA a permanent, credible, linkable home that deepens trust and enables action.

Suggested structure to build toward (to be refined in a build session):

- **Home / Landing** — Program mission ("Save the Planet with Data"), OB1 persona intro, links to social channels, featured/latest odyssey.
- **Odyssey index** — Browsable list/grid of all odysseys (title, location, one-line hook, thumbnail/video).
- **Individual odyssey page** (repeatable template), containing:
 - Problem Statement
 - Analysis (data visualizations/charts encouraged — this is a data-forward program)
 - Call to Action (specific, actionable — e.g., regulations to support, organizations to contact, behaviors to change)
 - Sources (full citation list)
 - Datasets (downloadable and/or embedded/visualized)
 - Embedded or linked short-form video(s)
- **About / Program page** — Explains the "Save the Planet with Data" thesis and the OB1 persona/background, for credibility with new visitors.
- **Data/transparency section (optional but on-brand)** — A place that reinforces the program's analytics credibility (e.g., methodology notes, data update cadence).
- **Call To Action Page** - (specific, actionable — e.g., regulations to support, organizations to contact, behaviors to change)

Tone/brand notes for design:

- Data-forward and credible, not preachy — evidence should carry the emotional weight, not rhetoric.
 - Playful "OB1" persona layered on top of serious content — brand personality without undermining trust.
 - Should feel built for shareability (clean links per odyssey to drop into social bios/captions).
-

6. Dataset Decisions

- **Datasets:** Each odyssey's analysis is built on published third-party datasets (not proprietary data). These source datasets — as **raw CSV** — will be published or linked on the odyssey's page alongside the analysis, so visitors can see and download the exact data behind the claims. This reinforces the program's "show your work" data-forward credibility goal.

7. Open Items / Not Yet Decided

- Final information architecture and page count.
- Specific static site tooling/framework (to be proposed by Claude Code).
- Full source list and dataset for each odyssey — content is still being researched and produced.
- Whether any datasets also get an in-page chart/visualization in addition to the raw CSV, on a per-odyssey basis.
